Window Film Installers

RISK ASSESSMENT

With reference to PR Solar carrying out installations of window film, it is necessary with the majority of window film installations to use steps ladders or hop-ups, and on occasions to use towers or cherrypickers.

The majority of window film application is applied internally.

On any one installation it is PR Solar's policy to ensure that there will always be two fitters where necessary to minimize risk, i.e. should a member of the installation team become unwell or have an accident the second staff member will be on hand to raise the alarm and contact the necessary emergency service.

When using steps ladders they will always be held and footed by the second staff member where necessary. In cases of awkward access where a tower or cherrypicker to be used, two fitters are necessary, one fitting and one stationary at bottom of equipment to minimize risk.

Windowfilm is applied with a water solution necessitating a small area to be cordoned off with appropriate signage.

On all installations the fitters will only take the necessary equipment required to carry out the installation and these are secured to the fitters tool belt or locked in a tool box.

Safety clothing to be worn where necessary, i.e. hard hat, high-viz jacket and safety boots. If cherrypicker to be used a safety harness would be worn.

Any nearby equipment will be covered by clean dust sheets.

When the installation is complete the area immediate to the installation is left in a clean and safe condition, i.e. disposal of window film cuttings and used blades.

PR Solar are covered by Public Liability Insurance. On request, a copy of the Policy is available.

Mr Paul Reeves of PR Solar has over 8 years experience in the installation of all types of window films both external and internal.
